

# **Vulnerable Employment Outcomes of Youth in Egypt, Jordan and Tunisia**

**By Shireen AlAzzawi and Vladimir Hlasny**

“Faced with oppression and few opportunities, the region’s youth is wasting away.” (*Economist*, August 6, 2016)

## Wasted youth

Youth\* population and unemployment in the Arab world

Total  
population  
2016, m

2

## Unemployment in 2019 by Age and Gender, ILO modelled estimates.

● Young female (15-24) ● Young male (15-24) ● Adult female (25+) ● Adult male (25+)

# Unequal access to Decent Employment: key challenge facing MENA youth

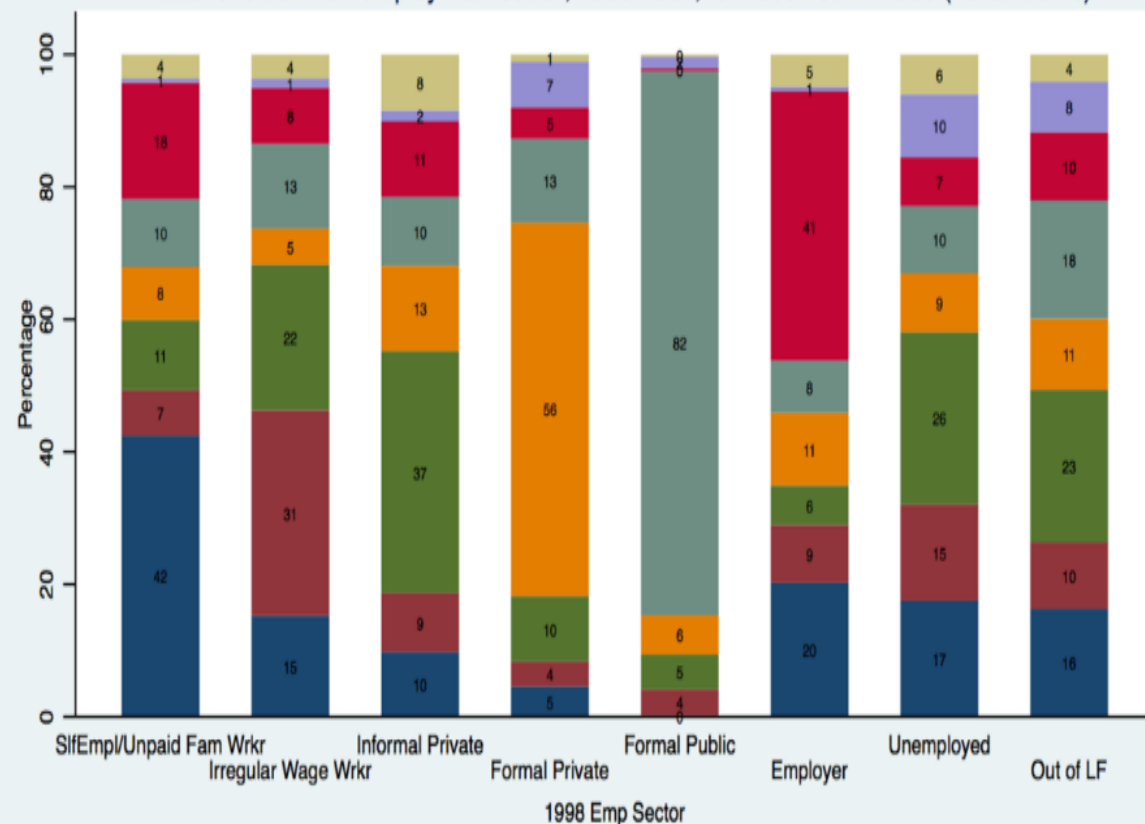

- Middle East and North Africa (MENA) region youth face notoriously precarious employment prospects.
- Youth unemployment rates are the highest in the world, at 29% for the region on average.
- Youth unemployment is as high as 40% for male youth and over 60% for female youth, in some countries in the region.
- Moreover, youth often accept employment in informal, unsafe and unstable jobs, underemployment, or are forced to migrate to find good jobs. Over 85% of youth in the region are in informal employment in 2020.
- MENA countries also have the highest regional proportion of youth Not in Education, Employment, or Training (NEET), in the World, at over 30%, with a large gender gap.
- Youth population (aged 15-29) is estimated at 110 million.

# Vulnerable Employment

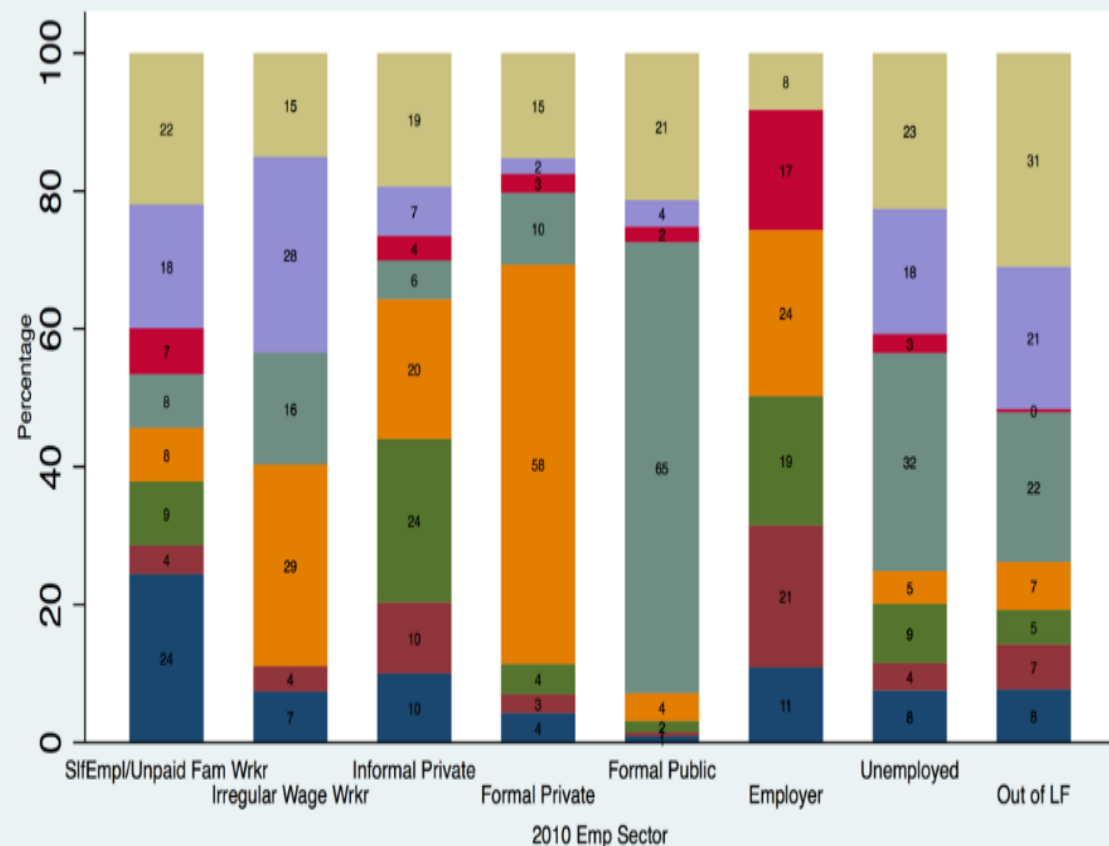

- ▶ We define vulnerable employment as the sum of
  1. unpaid family workers
  2. self-employed (without employing others)
  3. irregular wage workers
  4. informal private sector workers
- ▶ All these workers share undesirable job characteristics such as
  - ▶ lack of a contract: job security is almost completely nonexistent
  - ▶ absence of benefits such as health and social insurance, and paid leaves
  - ▶ low wages
  - ▶ high risk in terms of health and safety hazards
- ▶ Irregular Wage workers are particularly vulnerable in the MENA context.

# Employment-sector transitions Egypt 1998 to 2006, and 2012 to 2018, male non-student youth

Transitions between employment sector, 1998-2006, for 1998 Youth Males (nonstudents)

# Employment Transitions, Jordan (2010-2016) and Tunisia (2011 to 2014)

Employment by Age, Men in 2006

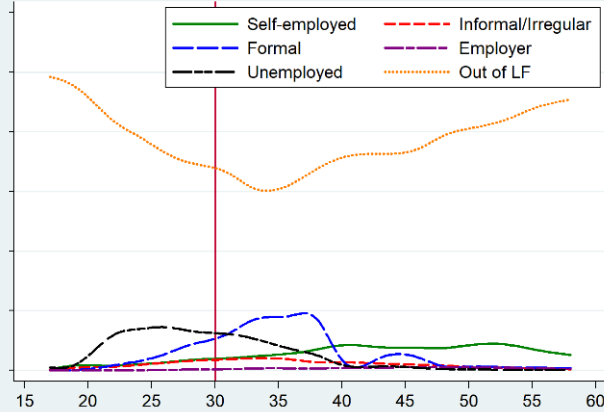

Employment by Age, Women in 2006

Employment by Age, Men in 2012

Employment by Age, Women in 2012

Employment by Age, Men in 2018

Employment by Age, Women in 2018

Employment by Age, Men in 2016

Employment by Age, Women in 2016

Employment by Age, Men in 2014

Employment by Age, Women in 2014

# Regression Analysis: workers characteristics and employment outcomes most notable results

- Coefficient on “youth” confirms that **youth in Egypt, Jordan and Tunisia have significantly lower probability of becoming employed in any type of employment compared to non-youth workers, particularly in formal employment or as employers.**
- **Women have lower probability of joining the labor force, particularly in the private-sector.**
  - **The gender gaps in the probability of employment are larger in Egypt than in Tunisia, and substantially larger than in Jordan.**
- **Education has a consistently positive effect on the probability of higher-quality employment, but employment-probability returns to education are lower for women in Egypt**
  - **University graduates in all countries, both male and female, also have among the highest probability of staying unemployed** (relative to being inactive).

# Some notable results (cont.)

- In all countries, household **wealth has a positive effect on workers' probability of becoming employers, and negative effect on the odds of attaining informal or irregular employment** or being unemployed.
- **Father's employment status has a strong effect** on children's employment status, confirming strong **intergenerational transmission of employment status**, since fathers' employment type has the greatest effect on the probability of the same employment type of their children.
- **Workers in female-headed households**, have higher probability of joining the labor force, but **lower odds of finding formal employment**.
- Across subnational regions, **urban workers have significantly higher probability of being unemployed, working informally, being self-employed/unpaid or employing others**.
- Finally, **time indicators show that workers' prospects of landing formal jobs fell, and those of remaining out of the labor force increased over time, pointing to deteriorating labor market conditions**.

# Concluding Remarks

- 
- Youth in Egypt, Jordan & Tunisia are severely disadvantaged compared to non youth in terms of employment outcomes with most youth ending up in vulnerable jobs such as being self-employed, an unpaid family worker, an irregular wage worker or in the informal private sector.
  - Dynamic analysis confirmed that youth who start out in the labor market in a vulnerable job are unlikely to move to a better quality job over time. Family wealth and father's education were important determinants of employment outcomes and these associations persist even after a long period of work experience.
  - Multinomial probability regressions confirmed that youth workers are less likely to attain decent employment than non-youth workers, particularly in formal employment, and that education, family status and gender are important determinants of employment outcomes.
  - Results also point to deteriorating labor market conditions over time in all three countries.
