

Skills for the **green transformation**

What are “green skills” and why are they so important?

There is a global sense of urgency in addressing **climate change**, which means rethinking the way we live and work. To implement this “**green transformation**”, we need to update existing jobs and develop new occupations in two categories: **technical green skills** and **transversal (soft) green skills**. **Technical** green skills are needed in existing occupations (e.g. energy efficiency in construction, sustainable farming or waste recycling expert) and in new jobs such as solar panel technician, green hydrogen engineer or sustainable fashion designer. **Transversal** green skills include teamwork, problem-solving, disruptive thinking, embracing diversity and inclusion, and systems thinking.
